Meta-Analysis of the Detection of Plant Pigment Concentrations Using Hyperspectral Remotely Sensed Data

Jingfeng Huang¹, Chen Wei^{1,2}, Yao Zhang¹, George Alan Blackburn³, Xiuzhen Wang^{4*}, Chuanwen Wei¹, Jing Wang¹

- [10.1371/journal.pone.0137029](https://doi.org/10.1371/journal.pone.0137029)
- Predictive relationships between hyperspectral regions and pigments is strong at leaf scale but decreases at canopy and landscape scales (Figure 1).
- Provides a way to compute a “meta-analysis” R^2 over the 85 papers considered (Figure 2).

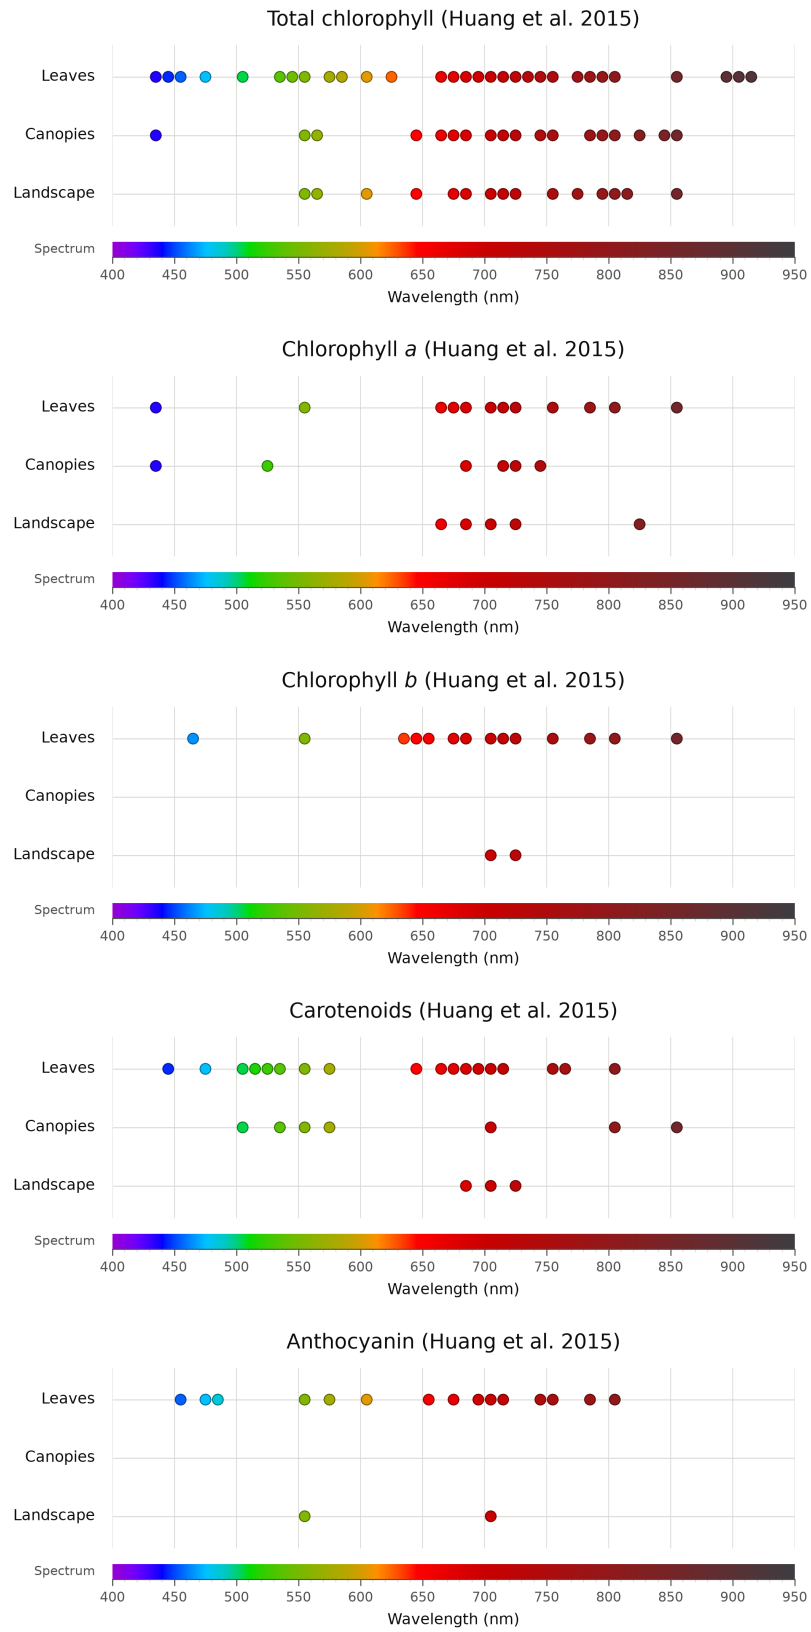

Figure 1: Meta-analysis of 85 studies. A dot denotes the 10 nm bin being reported as predictive in at least one study.

Meta-analysis R^2 for pigments (Huang et al. 2015)

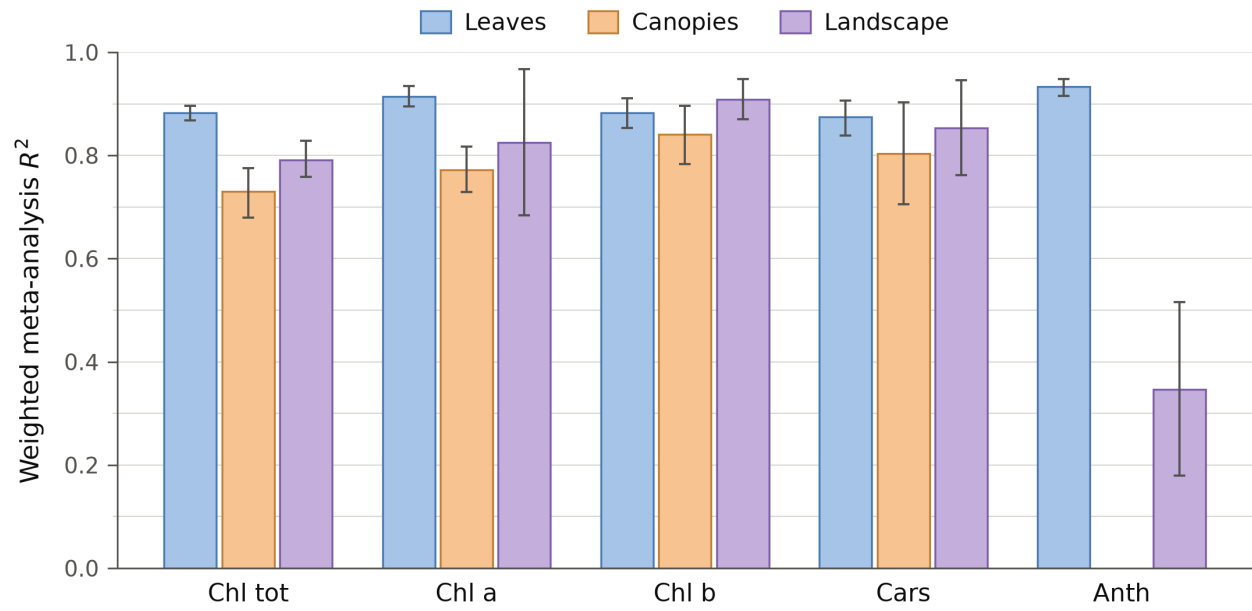

Figure 2: Weighted meta-analysis R^2 for each pigment at each observation scale, based on meta-analysis of 85 studies.
